

EXPERIMENT 12

Implementing Security Features and Governance / Administration Practices in Zoho Creator

Name: Karpaga Sundari V

Roll Number: 241401037

Course: _____

Date: _____

1. Aim

To set up security features and good administration practices in a Zoho Creator application. This includes user access, profiles, permissions, data protection, safe release of changes, and regular review.

2. Procedure

The steps below use an example app, *Bank Loan Application*, with three kinds of users: Admin, Loan Officer and Applicant. The app and names are examples. Menu names may differ slightly in your Creator version.

Step 1. Sign in to Zoho Creator with an administrator account. Open an existing app or create a new one (for example, *Bank Loan Application*).

Step 2. Protect the accounts. Turn on two-factor authentication in the Zoho account security settings, and use a strong password.

Step 3. Open the user management area of the app settings. Invite the users by e-mail.

Step 4. Create profiles for the roles: **Admin**, **Loan Officer** and **Applicant**. A profile decides what a user is allowed to do.

Step 5. Set permissions on each form and report. Decide who can view, add, edit and delete records.

Step 6. Hide sensitive fields (for example, credit score or ID number) from profiles that do not need them.

Step 7. Share the app with each user and assign the correct profile to each one.

Step 8. Add a simple Deluge check on the form so that only a loan officer can approve or reject a loan (illustrative code is shown in Section 3.4).

Step 9. Use the Development, Stage and Production environments, if your plan has them. Build in Development, test in Stage, and publish to Production.

Step 10. Review the setup often. Remove users who no longer need access, and check the records and activity history for unusual changes.

Step 11. Log in as each type of user and confirm that each one sees only what they should. Take a screenshot of each result for the record.

3. Output

No screenshots were supplied for this report. The items below are therefore **illustrative diagrams, tables and code** that explain the setup. They are not results from a live test.

3.1 Security layers in the app

Figure 3.1: Layers of protection from sign-in to data (illustrative diagram).

3.2 Access plan for the example app

Item	Admin	Loan Officer	Applicant
Loan Application form: add	Yes	Yes	Yes
Loan Application: view all records	Yes	Yes	Own only
Loan Application: edit	Yes	Yes	Own, before review
Loan Application: delete	Yes	No	No
Approve / reject a loan	No	Yes	No
Credit score field	Visible	Visible	Hidden
Manage users and profiles	Yes	No	No

Table 3.2: Planned access for each profile (example plan for a fictional app, not a tested result).

3.3 Safe release with environments

Figure 3.3: Moving changes from Development to Production (illustrative diagram).

3.4 Example Deluge check for loan approval

```
// ILLUSTRATIVE EXAMPLE - not tested.
// Field names are examples. Place in the form's
// "On Validate" or the approval action.
if(zoho.loginuserid != input.Officer_Email)
{
    alert "Only the loan officer can approve this loan.";
    cancel submit;
}
```

Code 3.4: Illustrative loan approval check.

3.5 Administration review checklist

Check	Why it matters	How often (suggested)
Review the user list	Removes access for people who left or changed role.	Every month
Review profiles and permissions	Stops users from getting more access than needed.	Every term / quarter
Check activity and record history	Helps find unusual or wrong changes.	Every week
Test in Stage before Production	Prevents errors reaching real users.	Before each release
Check account security (2-step sign-in)	Protects against stolen passwords.	Every term / quarter

Table 3.5: Review checklist (suggested schedule, not a fixed rule).

3.6 Screenshots from the live app

Screenshots can be placed here after the steps are done in Zoho Creator (for example: user list, profile permissions, form permissions, and a test login for each role).

Figure 3.6: Placeholder for the student's own screenshots.

4. Final Result

The security and governance steps for a Zoho Creator application were written down and explained. They cover user access, profiles, permissions, hidden fields, safe release, and regular review.
